Introduction

Description

IMCEE-XML is Ingram Micro's XML ecommerce solution that uses cutting edge technology allowing business process and system integration with our trading partners. It is a solution designed to meet and exceed our Trading Partners requirements.

Put simply, IMCEE-XML will deliver *cost reduction* and *process improvement* of day-to-day business activity with our Trading Partners.

IMCEE-XML is *easier, quicker* and *cheaper* to implement than other integrated solutions such as EDI. This will cut down the development time and will allow Ingram Micro and its Trading Partners to integrate their systems more quickly. Integrated systems bring obvious benefits such as less phone calls for price and availability checks and order placement. It allows the Trading Partner to manage their own business activity with less reliance on Ingram Micro sales representatives to manage their account.

IMCEE-XML allows *seamless integration* of the order process from the Trading Partner to Ingram Micro. Trading partners can empower their purchasing team to have instant access to Ingram Micro's inventory and can also be used to provide a similar 'virtual warehouse' scenario to an end-user website. Data and process flows can be incorporated into a Trading Partners financial and ordering system, desktop applications and more.

IMCEE-XML provides functionality that is divided into distinctive transactions that have been designed to allow business process flexibility, optimum performance and to limit the amount of redundant data. Each transaction can be uniquely applied to certain key areas of the order management process and can be combined to provide a wealth of information.

IMCEE-XML is a *real-time system*, which means that transactions are processed within seconds and provide accurate data directly from Ingram Micro 24 system. Trading Partners can use the power of IMCEE-XML to deliver fast and accurate data internally to their purchasing team and to their customers. High quality, high accuracy and high-speed data allows business decisions to be made with confidence.

The transactions available through IMCEE-XML

Price & Availability (P&A) – Up to 50 Ingram Micro SKU's Price and Availability information can be queried in a single IMCEE-XML transaction.

Product Details – You can retrieve product details such as basic product information (Part Number, EAN, Product Description, Warranty, etc.), as well detailed product parameters, images, related products, etc. (Please note that availability of detailed product parameters is subject to certain agreements.)

Order Entry – This is the transaction in which products can be ordered with the possibility to specify customer reference number, ship-to address, end user, requested price, etc., or even attach files.

Order list – List of orders can be queried by own reference number, status, and time period.

Order Details – Information of both the open and invoiced orders can be retrieved in high detail using this transaction, such as basic order details, status of your order (and order lines), invoice numbers, tracking numbers, serial numbers, etc.

Invoice list – List of invoices can be queried by issue date, IM order number, or by status.

Invoice – Provides complete information of a single invoice, including payment status, serial numbers, VAT break-down, exchange rate used, etc.

Delivery Addresses List – List of all existing delivery addresses for your company can be requested.

Elements/Attributes explanation

The specification for the Transactions Elements (and the data they may contain) is shown in the tables below marked Elements/Attributes Description. To understand how this works, a brief explanation of XML Element tags and nesting is required.

XML Elements and Nesting:

1. Each Element consists of an opening and a closing tag.
2. Anything placed between these tags is said to be contained by those tags.
3. Additional information within an Element's opening tag is called an Attribute.
4. Each Element may contain data.
5. Each Element may contain 1 or more additional Elements, called child Elements.
6. Each of the child Elements are said to be contained or nested within a parent Element.
7. Each child Element may itself be a parent Element, thus the nesting can be on more than 1 level.

In the Data Description tables whenever an Element is a parent Element, both it's opening and closing tags are shown, to indicate what the child elements are. Each table has the following headings.

Element – Gives the opening and closing tags of the Element. Closing tags are not shown if the Element has no children.

Description – Describes the Elements function

Parent Element – Indicates the parent Element of the given child.

NL – Indicates the Nested Level, i.e. how far within the Parent/Child tree the Element resides. Helps to indicate which Elements are grouped together. 'A' indicates this is an Attribute, not an Element.

Min/Max Occurrences – Indicates the number of times the Element can be repeated, and whether the Element is compulsory. If an Element is not compulsory do not provide this in the XML message unless required. This only applies within the scope of the parent Element, i.e. a compulsory child is only compulsory if the parent Element is a part of the XML message. * indicates that an element can occur many times.

Data Type – If the Element contains data, this indicates the type of data that is accepted.

Min/Max Length – Indicates any constraints on the data if applicable.

Example Data – Provides an appropriate example of the data required

Further information about IMCEE-XML

Access to XML API – XML settings can be found under the Account section on [ingrammicro24.com](https://www.ingrammicro24.com). When your company administrator first visits the Access via API page, he/she will be asked to generate the API key necessary to initiate any XML communications via IMCEE-XML.

The screenshot shows the Ingram Micro24 homepage with a banner for 'WIEDZONERZY IT 2022'. Below the banner, there's a navigation bar with tabs: 'ADD COMPANY', 'LOGOUT', 'MY ACCOUNT', 'COMPANY', 'FINANCE', 'DOCUMENTS', 'USERS', 'ADDRESS BOOK', 'API' (which is highlighted with a red arrow), and 'PARTNER PROGRAM'. A dropdown menu is open under 'ADDRESS BOOK'.

CSV API file – Once the API key has been generated, it is possible to download the IngramMicro24 price list in a CSV file using the URL link specified on the Access via API page. This file is paramount to identify Ingram Micro ItemIDs. By default, the currency of the prices in this price list is the same as the manufacturer's currency. If you wish to change this, then you can do it on the Access via API page.

ACCESS VIA API

Data Formats

The number format used within IMCEE-XML:
99.99

The date format used within IMCEE-XML is:
YYYY-MM-DD

Support procedure

In the event of an issue or a query that may arise before, during and after the integration of IMCEE-XML, the support procedure is as follows:

Step 1. Verify that your query cannot be answered by the IMCEE-XML FAQ document that is located in the download section of the administration web site.

Step 2. Verify that the fault is not a data entry issue, and that all data submitted is correct.

Step 3. Collect as much information as possible on the issue, date, time, APIKey, MessageID, error message, etc., and keep a record of this.

Step 4. Contact CEE-XML_Support@ingrammicro.com.

Request/Response headers

Each request and response have a TransactionHeader section with specific elements inside that match the purpose of the given method. Certain elements are, however, common to the TransactionHeader:

Request / APIKey: The API key identifies your company, the admin user who generated the key on www.grammicro24.com, and also serves as a login for XML transactions. The API key is mandatory in **every** request. Considering that this key opens door to every IMCEE-XML transaction, it is recommended to renew it regularly.

Response / DocumentID: The unique identifier of each response message, so it can be used to trace it back in logs.

Response / TimeStamp: The time when the response message was sent.

Response / Errors: Possible error codes and their meaning are mentioned in this section.

Response / TooManyItems: If the conditions in the request result in more orders/invoices/items than allowed (usually 50), then this value is 'True'. In this case, it is recommended to narrow the conditions and resubmit the request.

```
POST /imapi/request HTTP/1.1

Method PnA (Price and Availability)

Description

Up to 50 Ingram Micro Item's Price and Availability information can be queried in a single IM-XML transaction.

PNARequest message example

```
<PNARequest>
  <TransactionHeader>
    <APIKey>1/9af4d8381781baccb0f915e55</APIKey>
    <MyPriceCurrency>EUR</MyPriceCurrency>
  </TransactionHeader>
  <PNAInformations>
    <PNAInformation ItemID="ZBGK42-202520-000"/>
    <PNAInformation ItemID="MD100-100000071BOX-I01"/>
  </PNAInformations>
</PNARequest>
```

PNARequest elements/attributes description

MyPriceCurrency – Preferred currency which the response message is supposed to return prices in. (Currency of all prices are mentioned in the response message.) Not mandatory.

FixExchRate – If the order is placed with Invoice Currency to be in local currency, then depending on the Order Currency Ingram might apply an Exchange Rate Fee on top of the standard price of the product:

Order Currency	Invoice Currency	Who bares the exchange rate risk	Exch. Rate Fee
Vendor currency (USD/EUR)	Local currency	Customer (price is converted to local currency at the time of invoicing)	Yes
Local currency	Local currency	Ingram Micro	No

ItemID – Unique identifier of products in Ingram Micro's catalog. [ItemIDs](#) can be retrieved from the CSV API file.

Method ProductDetails

Description

You can retrieve product details such as basic product information (Part Number, EAN, Product Description, Warranty, etc.), as well detailed product parameters, images, related products, etc. for up to 50 Items. (Please note that availability of detailed product parameters is subject to certain agreements.)

ProductDetailsRequest message example

```
<ProductDetailsRequest>
  <TransactionHeader>
    <APIKey>1/9af4d8381781baccb0f915e55</APIKey>
    <PreferredLanguageCode>PL</PreferredLanguageCode>
  </TransactionHeader>
  <ProductDetails>
    <Product ItemID="ZBGK42-202520-000"/>
  </ProductDetails>
</ProductDetailsRequest>
```

ProductDetailsRequest elements/attributes description

PreferredLanguageCode – Sets the preferred language of the returned product content. Please note that it only sets the preference, but if content for a given product is not available in that language, and English is available, then English content is returned. (The language of the content is always mentioned in the response message.)

ProductDetailsResponse elements/attributes description

Product Parameters – Product parameters are the same as product attributes. The parameters, which can have multiple values (e.g. parameter being ‘Wireless LAN Standard’, and values being ‘IEEE 802.11ac’ and ‘IEEE 802.11a/b/g/n’), belong to a Parameter group like ‘Network & Communication’. Parameter groups can be either ‘External’ or ‘Internal’ depending on the source of the corresponding parameter set and its values. (Usually there is one ‘Ingram’ internal Parameter group, and other external groups from our external content providers.)

Method Order

Description

The Order Request transaction is a real-time transaction that allows customers to place standard product orders to Ingram Micro using IMCEE-XML.

High-level description of Ingram Micro's order cycle:

1. Order creation – where all the processing parameters are set. Automatic validation is mostly on shipping address, product authorisation, and stock allocation.
2. Automatic and manual validation of the order – orders are checked for pricing errors or other eligibility conditions.
3. Credit validation – once the order has been validated at sales, it goes through a credit check. If credit is available, the order will process without issue.
4. Warehouse pick and ship – here is where the physical stock is pulled from the different warehouse locations and sent to the delivery bay for collection by the carrier. All of the shipment information is created at this stage (packing slips, tracking numbers, serial numbers).

The order request transaction specifies typical order information such as who to ship to, where to ship to, which carrier to use for the shipment, what order processing logic should be used, list of products, the required quantity of the products, and many other key pieces of information.

Currently, order cancelation is not allowed through IMCEE-XML. If you want to cancel an order placed via XML, please contact your account manager directly.

OrderRequest elements/attributes description

Currencies – Orders can be placed in one currency, and invoicing to be requested in a different currency. DEF value in order currency will take default product currency (recommended option).

Shipping – You can select the desired shipping method how you would like to collect your order. If you want to the order to be shipped to the address provided, use the value '**courier**'. (Currently,) any other value means that you will collect the goods yourself from our warehouse.

DeliveryAddressID – List of address IDs that belong to your Company can be queried using the DeliveryAddressesList method. If DeliveryAddressID is not set, order must contain DeliveryAddressAlt. If both DeliveryAddressID and DeliveryAddressAlt are set, then the DeliveryAddressID prevails.

Partial Shipment – You can control whether orders should only be shipped when the order is complete, or do you allow partial shipments. If you allow partial shipments, then IM can fulfill your order in multiple rounds.

Method OrdersList

Description

The method returns all order numbers that meet your conditions based on your own reference number, status or date. The order numbers then can be used to retrieve more details about each individual order. A maximum of 50 orders are returned in a single query.

OrderListRequest message example

```
<OrdersListRequest>
  <TransactionHeader>
    <APIKey>1/9af4d8381781baccb0f915e55</APIKey>
  </TransactionHeader>
  <OrdersList CustomerReferenceNumber="1234/2019"
    OpenOrdersOnly="Yes"
    StartDate="2019-01-01"
    EndDate="2019-07-31" />
</OrdersListRequest>
```

OrdersListResponse elements/attributes description

Order status – Both in the OrderList and the OrderDetails method, you'll receive status information of your orders. The following statuses exists:

Status	Description
Customer approval required	Partner placed the order, and partner's own settings on IM24 puts the order on hold. Someone from the Customer with proper rights has to log in to IM24 and release the order.
Order received	Partner submitted (and approved) the order.
In progress	The order is sent to the ERP system and is being checked and processed.
Pending Export Control	The order was selected for export control validation and validation.
Pending Credit Check	Order is waiting for Credit release by finance team.
Shipped	Order has been shipped.
Canceled	Order was canceled.

Method InvoicesList

Description

A list of invoices can be queried by issue date, IM order number, own reference number, and/or by status. A maximum of 50 invoices are returned in a single query.

InvoicesListRequest message example

```
<InvoicesListRequest>
    <TransactionHeader>
        <APIKey>1/9af4d8381781baccb0f915e55</APIKey>
    </TransactionHeader>
    <Invoices StartDate="2019-07-01"
              EndDate="2019-07-15"
              IMOrderID="12345"
              Status="Unpaid"/>
</InvoicesListRequest>
```
